

Part 2 – I enhanced the look, layout and responsiveness of the Tshiawelo Primary School website by using an external CSS stylesheet. I have linked the same style.css file to all six HTML pages, so the website looks the same.

I added a CSS reset and global styles to remove default margins and paddings and used box-sizing: border-box to make it easier to control the sizing of elements. I have also added general styles to the body such as font, font size, line spacing, text color, and background color (Arial font).

I styled the headings and paragraphs for typography, adjusting font sizes, font weights, line heights, letter spacing, and element spacing. The main headings were also in the Navy to be in line with the style of the school's website.

I used Flexbox for the navigation bar of the layout. This meant the navigation links could be nicely centered and spaced out. I also used CSS Grid on the Gallery page to display the images in two columns on larger screens. The last gallery image was between the two columns halfway.

I added some visual styling, using white, red, and navy as the main colors. I designed the Gallery cards, navigation bar, bottom, forms, form fields and submit buttons with background, borders, padding and rounded corners.

I also added pseudo classes to make the website interactive. I styled the submit buttons and navigation links with hover: focus and: active styles. For example, the colors of the navigation links and submit buttons change when the user interacts with them.

I used media queries at 768 and 480 pixels for responsive design. On smaller screens, the Gallery collapses from two columns to one, the main content adjusts to the available screen width, the navigation links stack vertically on mobile devices, and the font sizes get smaller.

I also made them responsive to prevent the images, video, and Google Maps from overflowing the screen. I've added the viewport meta tag to all 6 html pages so that the responsive design works well on mobile devices.

Finally, I tested the website with the Browser's Developer Tools at different screen sizes to ensure the pages are displayed correctly on desktop, tablet and mobile devices.
